Botanical Background

- Kingdom: Plantae
- (unranked):<u>Angiosperms</u>
- (unranked): <u>Eudicots</u>
- (unranked): Core eudicots
- Order: <u>Caryophyllales</u>
- Family: Plumbaginaceae
- Genus: Limonium
- Species: Limonium Latifolium

We can find the Limonium all over the globe, especially around beach lines, swamps and deserts

Propagation

- SUPREME™ plants are produced by tissue culture allowing for:
 - Genetical uniformity
 - Disease free plants
 - High growth potential

Propagation

Hardening:

- Cultures are cleaned of agar residues and applied to a well-aerated soil media
- After sticking the plantlets, mist is applied:
 - 1st week: 6-8 second pulses with 10 minute intervals (hot hours) to 40 minutes (cooler hours)
 - In following weeks pulses and intervals are lengthened
 - Fertilizer is also added at N = 100ppm
- Light intensity in the first stages of rooting should not exceed 15,000 Lux in midday hours
- Young plants are ready for marketing within 6 weeks

Propagation

Hardening

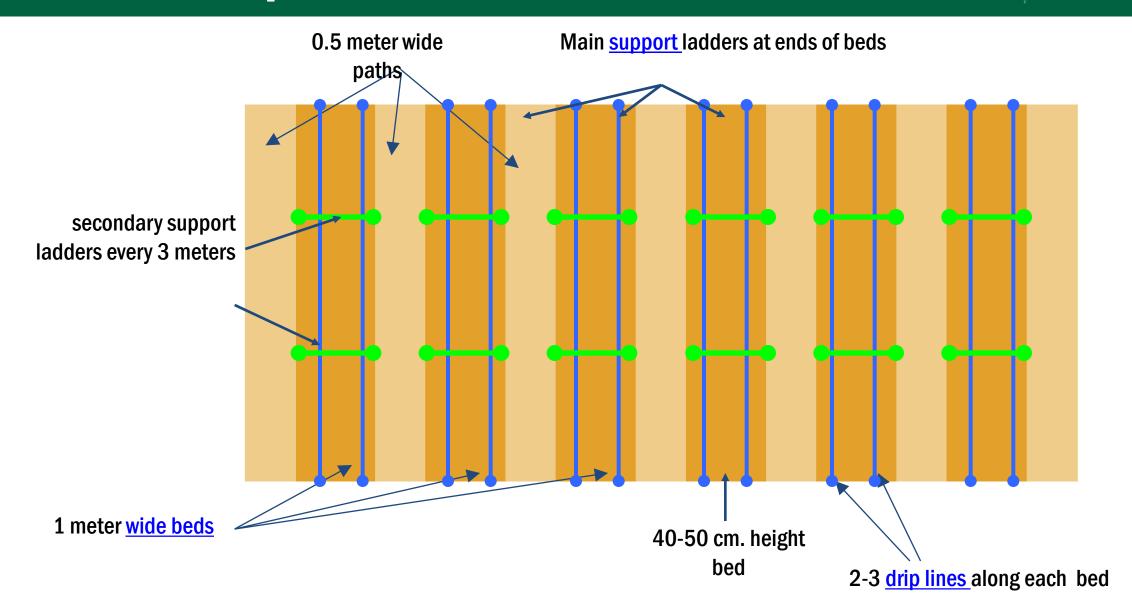

The Growth Cycle

- The first flush is relatively long: 20 to 22 weeks from planting to harvest
- Following flushes are shorter, around 12 to 14 weeks until harvest begins
- 2 to 2.5 flushes can be obtained per year
- In each flush around 5 to 7 marketable stems are harvested per plant.
- It is also possible to initiate a long continuous harvest without distinctive flushes
- Yield is 450,000 to 550,000 stems per hectare per year, depending on climatic conditions

Plot Preparation

Plot Preparation

Planting Density

- Recommended planting density is 5 to 6 plants per net square meter
- This equals approximately 32,500 to 39,000 plants per gross Hectare
- This is achieve by planting in two lines along each bed, with 33cm to 40cm spaces between plants.

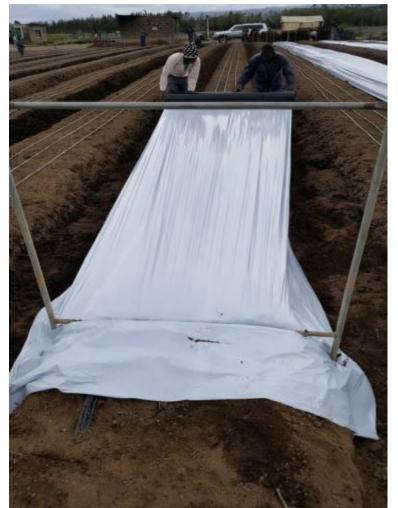

Planting

• In recent trials, covering the beds with a white plastic mulch was found to be beneficial.

- •They will be planted indoors. In open tunnel or greenhouse.
- •They can grow in light or heavy soil as long as the ground is aerated
- 2 supporting nets are needed for Limonium Supreme-30X30 cm.

Irrigation & Fertilization

Watering:

•After planting: 7-8 m³ of water via sprinklers + 2 m³ through the drip lines with fertilizer

2 weeks later

- In worm seasons 5-6 m³ per day
- In cold seasons 2-3 m³ per day

Fertilization: N:P:K in ppm

N	Р	K	STAGE OF DEVELOPMENT
70	20	70	Planting & establishing
250	30	150	Elongating until flowering

Pinching

- Plants will be pinched when the first branches elongates 1-2 times.
- The pinching point will be above the internode, to avoid die back and bacterial attack.

GA Treatments

- GA is applied after most plants in the field (~80%) have reached the desired stage.
- A first treatment of 500ppm to 600ppm is applied on the apex of the plants
- A second application is given two weeks later at half the concentration (250ppm to 300ppm)
- After the first treatment we will wait 7 to 10 days, in order to let the rosette to response to the GA.

Harvest

• Harvest the stems is done when 70-80% of the flowers on the stem are already open.

Post-Harvest

- Post Harvest:
- place in following solution for minimum of 4 hours
 - O **TOG₃ 0.15**%
 - O S.T.S. 0.10%
 - **Sugar 5.0%**
 - O GA 0.025%
- Place in cold room for maximum 24 hours
- Fumigate in cold room with **Divipan** (*dichlorvos* 100 g/L)

Pruning

- Pruning is done once a year, all the way down to the ground.
- When a new rosette develops spraying with GA3 is carried out just like in the first year
- •In between flashes old and yellowing foliage should be gently removed to allow for new foliage development and to let light into the rosette.

Pests and diseases

Limonium Supreme is sensitive to:

- Powdery Mildew
- Downy Mildew
- Spodoptera littoralis
- Aphid
- •Trips
- Nematode
- Pernospora
- Colletotrichum
